

Korea discovers first CSF outbreak in four years

South Korea's first outbreak of Classical Swine Fever (CSF) in four years has led to the culling of a herd of 300 pigs, reports the Organization of Animal Health (OIE).

The previous outbreak dated from April 2009, the OIE states. This time the outbreak was confirmed at a rearing farm in Siran-dong, in the province Gyeongsangnam-do, on the south coast of the Korean peninsula.

The infection was discovered on November 27 – one day later the OIE was informed. In total, four out of 300 pigs were found infected and as a result, all pigs were destroyed. The location of the outbreak can be seen on the [interactive map](#) included in the OIE report.
